Why is this property not copied into the base class? public partial class MainWindow : Window { public IList DeviceList { get; set; } = new List(); public MainWindow() { InitializeComponent(); // Instance property copy works DeviceList.Add("A"); DeviceList.Add("B"); base.DataContext = this; } // Constraint doesn't work public void AddDevice(string device) { DeviceList.Add(device); } } A: The reason this doesn't work is that XAML sends binding notifications (events) to the control that have bound properties. If you had a property change on the control, then the control would change its DataContext and BAM! That would invalidate all of its bindings, and then there'd be a really ugly cascade of exceptions. The property doesn't end up on the base class because you never set its value (or, more accurately, you don't set it as a property at all). The property is only set by the control (the object that "owns" the UI element). You're not actually making a change to that object's data; it's just, in some sense, magically copied into
